

Press report

Carl Stahl Kromer at the IFFA

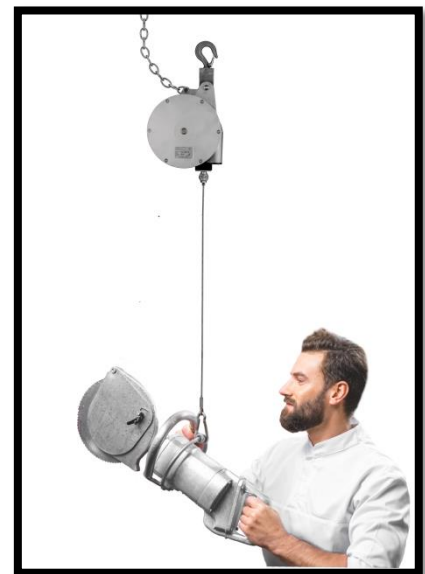

Gottenheim, May 10, 2019 - Carl Stahl Kromer presents a new product line made of stainless materials on the most important information platform of the meat industry in Frankfurt. Thus, the specialist for heavy loads and ergonomics in the workplace now also shows a solution for the meat processing industry.

Carl Stahl Kromer GmbH has been ensuring more efficiency, safety and ergonomics in the automotive production for years. Here the manufacturer is at home and known for its exceptionally high product quality.

At this year's IFFA, the company presented a new product line made of stainless materials. By using stainless materials and NSF-compliant fats, the products have been adapted to the industry conditions so that the meat industry now can benefit from the advantages of KROMER products too.

Easier, faster and safer work

In the meat industry, for example, Kromer products hold heavy saws ready for the cutting process at the desired height, thus ensuring precise and fatigue-free working - the valuable human resource is thus sustainably spared. The standard high safety features of KROMER products also promise a high degree of safety - for the worker as well as the tool itself. For example, a safety chain and a spring fracture safeguard ensure that the maximum fall height of the application is only 10 cm. In addition, Kromer products help to keep workplaces neat and organized. This can ultimately even increase the productivity of the workplace.

Further advantages and information on the stainless product line can now be found in a new product catalog. The catalog is available in the Download Center at www.carlstahlkromer.com.
